

My Product Journey: Rice — Product Fact Card

How to use this card: This document provides detailed information about rice in India. Read it carefully to extract facts for your graphic organiser.

Why Rice Matters — and Where It Comes From

Rice stands as India's most crucial staple food crop, nourishing over half of its vast population and holding a deep cultural significance in the nation's diverse diets. India is globally recognized as the second-largest producer of rice and holds the distinction of being the largest exporter, playing a vital role in global food supply chains. This essential grain is cultivated across a wide array of agro-climatic zones, primarily as a Kharif (monsoon) crop, though farmers in the hot and humid regions of eastern and southern India often manage to grow multiple crops throughout the year. Historically, rice cultivation in India dates back thousands of years, with archaeological evidence pointing to its presence in the ancient Indus Valley Civilization. The Green Revolution significantly boosted rice production through the introduction of high-yielding varieties and advanced farming techniques, transforming India into a major global agricultural power. Key organizations like the Food Corporation of India (FCI) and the Agricultural and Processed Food Products Export Development Authority (APEDA) play crucial roles in its management and trade, alongside major brands such as KRBL Limited (India Gate Basmati Rice), LT Foods (Daawat Basmati Rice), Kohinoor Foods, Patanjali Foods (Ruchi Gold Rice), and Adani Wilmar (Fortune Rice). Major rice-producing regions include the Gangetic Plains (Uttar Pradesh, Bihar, West Bengal, Jharkhand), the Brahmaputra Valley (Assam), the Coastal Plains (Andhra Pradesh, Telangana, Tamil Nadu, Odisha), and the Punjab-Haryana region, particularly renowned for Basmati varieties.

The Journey: From Paddy to Rice

The journey of rice begins with **Paddy Cultivation** across India's fertile plains and deltaic regions, including the Gangetic Plains and Godavari-Krishna Delta. Farmers, assisted by farm labourers, tractor operators, and irrigation workers, meticulously prepare fields, sow seeds (either by broadcasting, transplanting seedlings from nurseries, or direct seeding), and manage irrigation using pumps. They apply fertilizers and pesticides, and eventually harvest the paddy either manually or with combine harvesters and threshers. Following harvest, farmers transport their paddy to **Paddy Procurement & Initial Storage** centers, such as Agricultural Produce Market Committee (APMC) mandis or government procurement centers managed by the FCI, as well as private warehouses in producing states like Punjab, Haryana, and Uttar Pradesh. Here, mandi workers weigh and clean the paddy, while procurement agents assess moisture content using meters. Truck drivers then transport the paddy, often in jute bags, to godowns or silos for storage. The next crucial stage is **Rice Milling**, which occurs in specialized clusters across Punjab, Haryana, Uttar Pradesh, Andhra Pradesh, Telangana, and West Bengal. Mill operators, quality control technicians, and machine maintenance staff oversee a multi-step process involving paddy cleaners, de-stoners, huskers, separators, polishers, graders, and color sorters. After milling, wholesalers, distributors, logistics managers, and warehouse staff manage **Wholesale & Distribution**, transporting milled rice in large trucks (10-20 ton capacity) from mills to

major cities and distribution hubs nationwide. They use forklifts and pallet jacks in warehouses to handle bulk quantities before sales representatives facilitate sales to retailers and institutional buyers. Finally, at the **Retail Sales** stage, shopkeepers, sales assistants, cashiers, and stockers sell rice to end consumers in various pack sizes (1kg, 5kg, 10kg, 25kg, 50kg) at kirana stores, supermarkets like D-Mart and Reliance Fresh, and through online grocery platforms where delivery personnel ensure home delivery.

Raw Materials, Inputs, and Natural Resources

The primary raw material for rice is paddy, which is the un-hulled form of rice, sourced from major producing states including Uttar Pradesh, West Bengal, Punjab, Telangana, Andhra Pradesh, Odisha, Bihar, Tamil Nadu, Chhattisgarh, and Haryana. For the Kharif Marketing Season 2026-27, farmers receive a Minimum Support Price (MSP) of Rs 2,441 per quintal for common paddy and Rs 2,461 per quintal for A-grade varieties. India cultivates diverse types of paddy, yielding popular rice varieties such as Basmati, Sona Masuri, Kolam, and various short and medium-grain non-Basmati options. Beyond paddy itself, significant inputs are required for cultivation, with farmers investing approximately Rs 16,000-28,000 per acre for essentials like seeds, fertilizers, pesticides, labor, machinery, and irrigation. Rice cultivation is notably water-intensive; on average, 1500-2500 liters of water are consumed to produce just 1 kg of paddy across India, with regions like Punjab and Haryana exhibiting even higher footprints, ranging from 2270-2672 liters per kg. This high water usage contributes to groundwater depletion, especially in non-traditional rice-growing areas. Furthermore, the agricultural practices associated with rice have substantial environmental impacts, including significant methane emissions from anaerobic decomposition in flooded paddy fields, contributing an estimated 20-35% of India's methane emissions, and approximately 97 million metric tonnes of CO₂ equivalent annually from widespread rice straw burning, which also causes air pollution and soil nutrient loss. Overuse of synthetic fertilizers and pesticides also leads to soil degradation and water pollution.

How Rice Is Made — Step by Step

The transformation of paddy into edible rice occurs through a precise milling process, involving several distinct steps:

- Cleaning:** Mill operators initiate the process by feeding the raw paddy into a paddy cleaner and a de-stoner. These machines meticulously remove impurities such as dust, stones, straw, and other foreign materials, ensuring only clean paddy proceeds to the next stage.
- De-husking:** Next, mill operators direct the cleaned paddy into a paddy husker. This specialized equipment works to remove the tough outer husk layer from the grain, a crucial step that yields brown rice.
- Separation:** Following de-husking, machine maintenance staff ensure the paddy separator efficiently functions to segregate the brown rice from any remaining un-hulled paddy. Any un-hulled grains are then re-circulated back to the husker for further processing, maximizing yield.
- Polishing/Whitening:** Mill operators then guide the brown rice through a rice polisher or whitener. This stage involves carefully abrading the surface of the brown rice to remove the bran layers, which results in the familiar white rice. For certain varieties, a parboiling treatment might be applied before this milling sequence to alter grain texture and nutritional properties.
- Grading & Sorting:** Quality control technicians and sorters meticulously oversee the rice grader and color sorter machines. These advanced systems classify the white rice based on critical parameters such as size, shape, and color, ensuring consistency and quality across batches.
- Packaging:** Finally, packers utilize automated packaging machines to accurately weigh, fill, and seal the processed rice into various retail and bulk bags, preparing it for distribution to markets.

What It Costs to Bring Rice to You

The cost of bringing rice to your plate builds up through several stages, starting with the farmer. For the Kharif Marketing Season 2026-27, a farmer receives approximately Rs 2,441 per quintal for common paddy, translating to about Rs 24.41 per kg. This initial farm-gate value accounts for roughly 35% of the final retail price. After farmers deliver their paddy, procurement agents and mandi workers add Rs 50-150 per quintal (Rs 0.5-1.5 per kg) for transportation from the farm to the mandi, along with loading, unloading, initial storage, and their commission, contributing about 4% to the total cost. During the rice milling and processing stage, mill operators and their teams incur costs of Rs 150-300 per quintal (Rs 1.5-3.0 per kg) for electricity, labor, machinery depreciation, maintenance, and packaging materials, adding approximately 8% to the price. Subsequently, wholesalers and logistics managers add Rs 200-400 per quintal (Rs 2.0-4.0 per kg) for transportation, warehousing, handling, and their wholesale margin, which makes up about 12% of the retail price. Finally, retailers, sales assistants, and stockers add Rs 300-600 per quintal (Rs 3.0-6.0 per kg) as their margin and for store operational costs. Other costs, including packaging and marketing, contribute an additional Rs 3.0-10.0 per kg, with the retailer margin and other costs together accounting for around 41% of the final price. Regarding taxation, loose or unpackaged rice sold by shopkeepers is exempt from GST (0%). However, if rice is pre-packaged in fixed quantities and labelled as per the Legal Metrology Act (e.g., 1kg, 5kg, 10kg bags for retail sale), a 5% GST is levied. This applies to all varieties, including Basmati, but large 50kg sacks for business-to-business trading without retail declarations are generally exempt. The cumulative effect of these stages results in common non-Basmati rice retailing for Rs 35-70 per kg, while premium Basmati varieties range from Rs 80-200 per kg.

What Rice Costs in Shops — Price Research

The price of rice can vary significantly depending on the brand, variety, pack size, and the retail channel through which it is purchased. For instance, in June 2026, a customer in Bengaluru, Karnataka, purchasing 5 kg of India Gate Basmati Rice (Super) from a D-Mart supermarket would pay Rs 850.0, which breaks down to Rs 170 per kg. In contrast, a consumer in Mumbai, Maharashtra, buying a larger 10 kg pack of Daawat Rozana Gold Basmati Rice from Reliance Fresh would pay Rs 1200.0, making it Rs 120 per kg. Meanwhile, a local kirana store in Hyderabad, Telangana, offers loose Sona Masuri Rice for Rs 55.0 per kg. These price differences can be attributed to several factors. Branded rice, such as India Gate and Daawat, commands higher prices due to the added costs of sophisticated packaging, extensive marketing, stringent quality control, and the brand premium that consumers are willing to pay for perceived consistency and quality. The specific variety also plays a crucial role; Basmati rice, known for its distinct aroma and long grains, is a premium product and naturally more expensive than common non-Basmati varieties like Sona Masuri. Furthermore, the retail channel impacts pricing. Large supermarkets like D-Mart and Reliance Fresh often benefit from economies of scale through bulk purchasing and can offer competitive prices, especially on larger pack sizes, but they also incur higher operational costs (e.g., rent, air conditioning, extensive staff). A local kirana store selling loose rice, on the other hand, avoids packaging costs and often has lower overheads, allowing it to offer more budget-friendly options for daily consumption.
